Role of β-Adrenergic Receptors and Nitric Oxide Signaling in Exercise-Mediated Cardioprotection 216

John W. Calvert and David J. Lefer

This review defines the role that nitric oxide and β-adrenergic receptors play in mediating the cardioprotective effects of exercise in the setting of ischemia-reperfusion injury.

Elucidating Immune Mechanisms Causing Hypertension During Pregnancy 225

Babbette LaMarca, Denise Cornelius, and Kedra Wallace

Pre-eclampsia is a disease carrying high risks of mortality and morbidity among pregnant mothers and infants worldwide. Many immune mechanisms stimulated in response to reductions in uterine perfusion pressure (RUPP) have been identified as key players in the disease process.

Hypertension: What’s Sex Got to do With It? 234

Margaret A. Zimmerman and Jennifer C. Sullivan

This review highlights recent work examining sex differences in the molecular mechanisms of BP control in hypertension.

Darkness at the End of the Tunnel: Poststenotic Kidney Injury 245

Alfonso Eirin and Lilach O. Lerman

This review summarizes the pathogenic mechanisms involved in renal functional deterioration in patients with atherosclerotic renal artery stenosis.

Activating Autoantibodies and Cardiovascular Disease 254

Friedrich C. Luft

This review looks at the existence and actions of stimulating antibodies against G-protein-coupled receptors, as well as activating antibodies directed at the platelet-derived growth factor receptor tyrosine kinase, and considers the lack of mechanistic studies of receptor activation and translational studies to document receptor-stimulating antibodies as therapeutic targets.

Modulation of Soluble Guanylate Cyclase for the Treatment of Erectile Dysfunction 262

George F. Lasker, Edward A. Pankey, and Philip J. Kadowitz

The use of newer agents that stimulate or activate sGC to promote erection and treat erectile dysfunction is discussed in this review.
